Oil Lubrication Systems are utilized for example in the transportation, process and power industries. It is a standard available in two editions. It comes with a 5-Year warranty and meets most power standards. The standard is a combination of oil lubrication design parameters and selected equipment. In certain situations, this standard is combined with equipment to provide the required control, emission control, or thermal management system. Typical components include lubrication pumps, various types of pressure relief and filter valves, oil/fuel flow meters, and hydraulic/hydraulic power transmissions. It includes all critical aspects of the system, including the hardware, fluids, connections, equipment functions, operating parameters, and procedures. All major components are identified. The standard is defined in two editions, covering different application areas. The 2001 edition is intended for general manufacturing purposes and for use in machinery that has no specific applications. The 2007 edition is intended for use in industrial environments where the application of the system is specified. The 2007 edition adds piping, fume, mist and other wet-flowing media applications, as well as chiller-type systems, which are otherwise covered in another API standard. A key part of the standard is the use of ARCHIBUS 1011. This standard is available for purchase from Lube-Power. External links API 614 5th Edition – ISO 10438:2008 #0614 Responses of two broiler lines to acute and chronic phosphorus deficiency. Broilers were fed a commercial diet containing either adequate P (2.2 g P/kg diet) or low P (1.4 g P/kg diet) for five weeks. The two dietary treatments were applied to a bird of each genotype and the birds were then given either adequate or low P for five days. The response to this period of deprivation was assessed by measuring changes in the control of the acid-base balance, the blood biochemical parameters and bone turnover. The birds reared

on the low-P diet had a significantly higher serum total calcium and phosphorus levels than those fed the adequate-P diet. The response to the P deprivation, however, was genotype dependent. Low-P-reared chicks of the Fast-Turquoise
